

2021 (Google Map view of Nos 1-9)

These images of Prior Park Buildings dating from 1845 to the present day suggest that, originally, there were no more than one small upstanding dormer windows per property, at least since the 1840's until the 1920's.

So if such dormer windows are now more widely visible (and thus, presumably added during the past 100 years) does this not mean that, potentially, other items could be added to the external roof space, including modern Solar Photovoltaic Panels to produce locally generated renewable energy and thus help B&NES to reach their target of Zero Carbon by 2030?
